# **Keyless Connections ETP**®

# DISCOVER THE MANY WAYS KEYLESS CONNECTIONS FROM ZERO-MAX SAVE VALUABLE TIME AND RESOURCES IN PRODUCTION PROCESSES.

adial accessibility

#### **REASONS TO USE ETP KEYLESS CONNECTIONS**

Zero-Max's ETP\* keyless connections are the perfect locking devices for shaft-to-hub connections. ETP keyless connections are ideal for positioning and locking shaft components in a system, and provide the best solution where keyways can weaken or cause excess wear to the shaft.

ETP keyless connections also address applications for synchronizing moving parts. They enable precise mounting of shaft components where frequent readjustments are required, in systems where balance and runout are inherent problems, and where common fastening, adjusting, and holding of shaft components are required.

We offer keyless locking devices that are designed to solve specific application requirements, such as high transmittable torque. Our ETP-CLASSIC and ETP-EXPRESS keyless connections are available in stainless steel for corrosion protection and to handle frequent washdowns.

- Mounting or dismantling in less than 10 seconds
- Shorten downtime for field servicing
- Fewer screws than alternative products
- Fast changeovers
- Zero backlash and superior concentricity
- Good corrosion resistance

- High radial load capacity.
- Mounting and dismantling is fast.
- Precision adjustment of the hub can be made during mounting.
- Low tightening torque and small number of screws makes mounting easy and quick.
- Excellent concentricity even after many mountings.
- Hexhead screws can also be used.
- Handles temperature range -22°F to +185°F.

T = Transmittable torque when axial force is 0. FA = Transmittable axial force when torque is 0. FR = Maximum radial force during continuous operation.

Maximum allowed bending torque = 15% of transmittable torque T. \*The tolerance grade k6-h8 is a range between the upper limit of the ISO grade k6 and the lower limit of the ISO grade h8.

Note: if the shaft is machined to a strict k6 tolerance range the transmittable torque will increase by 20%.

ETP-Classic consists of a double-walled hardened steel sleeve filled with a specially designed pressure medium, sealing ring, piston, pressure flange and clamping screws.

#### **OPERATION**

When tightening the actuation screws, the sleeve expands uniformly against the hub and shaft and creates a rigid joint. When loosening the actuation screws the sleeve returns to its original measurements and can easily be dismantled.

T = Transmittable torque when axial force is 0. FA = Transmittable axial force when torque is 0. FR = Maximum radial force during continuous operation. Maximum allowed bending torque = 15% of transmittable torque T. \* The tolerance grade k6-h8 is a range between the upper limit of the ISO grade k6 and the lower limit of the ISO grade h8. Note: if the shaft is machined to a strict k6 tolerance range the transmittable torque will increase by 20%.

#### **DESIGN**

ETP-CLASSIC S (short model) for applications requiring a smaller foot print. Same features as a standard ETP-CLASSIC. Consists of a doublewalled hardened steel sleeve filled with a specially designed pressure medium, sealing ring, piston, pressure flange and clamping screws.

#### **OPERATION**

When tightening the actuation screws, the sleeve expands uniformly against the hub and shaft and creates a rigid joint. When loosening the actuation screws the sleeve returns to its original measurements and can easily be dismantled.

#### **STAINLESS STEEL**

#### **FEATURES**

- All parts exposed to the environment are made of stainless steel.
- Mounting and dismantling is fast.
- Precision adjustment of the hub can be made during mounting.
- Low tightening torque and small number of screws makes mounting easy and quick.
- Excellent concentricity even after many mountings.
- Hex head stainless steel screws.
- Handles temperature range -22°F to +185°F.

T = Transmittable torque when axial force is 0. FA = Transmittable axial force when torque is 0. FR = Maximum radial force during continuous operation. Maximum allowed bending torque = 15% of transmittable torque T.

ETP-CLASSIC R (stainless steel construction) are ideal for food and medical applications requiring frequent wash-downs. ETP-CLASSIC R consists of a double-walled hardened stainless steel sleeve and stainless hardware, filled with a specially designed food-grade pressure medium, sealing ring, piston, pressure flange and clamping screws.

#### **OPERATION**

When tightening the actuation screws, the sleeve expands uniformly against the hub and shaft and creates a rigid joint. When loosening the actuation screws the sleeve returns to its original measurements and can easily be dismantled.

- Fast and frequent mounting/dismantling with a single actuation screw.
- Radial screw positioning saves space along the
- Accurate positioning. No axial movement when mounting.
- Uniform surface pressure against shaft and hub prevents damage to surfaces and enables the use of small diameter hubs.
- Handles temperature range -22°F to 185°F.
- ullet Excellent runout,  $\leq 0.02$  mm, even after several mountings.

T = Transmittable torque when axial force is 0. FA = Transmittable axial force when torque is 0.

FR = Maximum radial force during continuous operation. Maximum allowed bending torque = 5% of transmittable torque T.

\* Indicated items are available but not included in standard production runs. If not in stock they are built to order. Contact factory with questions or for current price and lead-time quote.

#### **DESIGN**

ETP-EXPRESS consists of a double-walled hardened steel sleeve and flange filled with a pressure medium. Located in the flange are one or two actuation screws and piston with seal, used to pressurize and maintain pressure in the connection.

#### **OPERATION**

When the actuation screw is tightened, the double-walled sleeve expands uniformly against the shaft and hub and creates a rigid friction joint. Dismantling is done by loosening the screw which returns the ETP-Express to its original dimensions. It can then easily be dismantled.

Tt = Recommended tightening torque for actuation screw. Further tightening does not increase the pressure in the connection.

\*D2 is valid before mounting \*\* Pressure screws positioned in the same direction. Dimensions subject to alterations without notice

## **STAINLESS STEEL**

#### **FEATURES**

- Fast and frequent mounting/dismantling with a single actuation.
- Radial screw positioning saves space along the shaft.
- Accurate positioning. No axial movement when mounting.
- Flat flange design allows for easy cleaning.
- Pressure medium and screw lubricant are food approved.
- All parts exposed to the environment are made of stainless steel.
- Uniform surface pressure against shaft and hub prevents damage to surfaces and enables the use of small diameter hubs.
- Handles temperature range -22°F to 185°F.
- Excellent runout, ≤0.02 mm, even after several mountings.

T = Transmittable torque when axial force is 0. FA = Transmittable axial force when torque is 0. FR = Maximum radial force during continuous operation. Maximum allowed bending torque = 5% of transmittable torque T.

**STAINLESS STEEL** 

#### **DESIGN**

ETP-EXPRESS R (stainless steel construction) consists of a double-walled hardened stainless steel sleeve and flange filled with a food-grade pressure medium. Located in the flange is a single actuation screw piston with seal, used to pressurize and maintain pressure in the connection.

#### **OPERATION**

When the actuation screw is tightened, the double-walled sleeve expands uniformly against shaft and hub and creates a rigid friction joint. Dismantling is done by loosening the screw which returns the ETP-EXPRESS R to its original dimensions. It can then easily be dismantled.

- Tt = Recommended tightening torque for actuation screw. Further tightening does not increase the pressure in the connection.
- \* D2 is valid before mounting Dimensions subject to alterations without notice

- Extremely fast mounting/dismantling with only one or two screws.
- Can be mounted/dismantled 1000's of times.
- Extremely good concentricity, ≤0.006 mm, even after several mountings.
- Dual sealing system.
- Radial tightening of the screw saves space along the shaft.
- Small built-in dimensions.
- Accurate positioning, no axial movement when mounting.
- Handles temperature range -22°F to 230°F.

T = Transmittable torque when axial force is 0. FA = Transmittable axial force when torque is 0.
FR = Maximum radial force during continuous operation. Maximum allowed bending torque = 10% of transmittable torque T.
Indicated items are available but not included in standard production runs. If not in stock they are built to order. Contact factory with questions or for current price and lead-time quote.

#### **DESIGN**

ETP-TECHNO consists of a double-walled hardened steel sleeve and flange filled with a pressure medium. Located in the flange are one or two actuation screws, piston with seal, used to pressurize and maintain pressure in the connection. The unique design of the piston provides a secondary sealing system which helps maintain bushing pressure.

#### **OPERATION**

When the actuation screw is tightened, the double-walled sleeve expands uniformly against the shaft and hub and creates a rigid friction joint. Dismantling is done by loosening the screw which returns the ETP-TECHNO to its original dimensions. It can then easily be dismantled.

T = Transmittable torque when axial force is 0. FA = Transmittable axial force when torque is 0. FR = Maximum radial force during continuous operation. Maximum allowed bending torque = 10% of transmittable torque T. \*The tolerance grade k6-h7 is a range between the upper limit of the ISO grade k6 and the lower limit of the ISO grade h7.

#### **DESIGN**

ETP-POWER consists of a double-walled hardened steel sleeve and flange filled with a specially designed pressure medium. The flange contains a single actuation screw piston with seal that are used to pressurize and maintain pressure in the connection. Also in the flange are two pre-machined bores that can be used to attach ETP-POWER to the mounted components when the connection is not pressurized.

#### **OPERATION**

When the actuation screw is tightened, the double-walled sleeve expands uniformly against the shaft and hub and creates a rigid friction joint. Dismantling is done by loosening the screw which returns the ETP-POWER to its original dimensions. It can then easily be dismantled.

Tt = Recommended tightening torque for actuation screw. Further tightening does not increase the pressure in the connection.

<sup>\*</sup> D2 is valid before mounting \*\* Pressure screws positioned in the same direction. Dimensions subject to alterations without notice

- High transmittable torque capacity can be varied by changing the mounting pressure.
- Very high radial load capacity.
- Fast mounting/dismantling in tight spaces.
- Radial and axial connection is possible.
- Fine adjustments of the hub can be made when mounting.
- Good concentricity even after several mountings.
- With ETP-HFC coating double torque capacity.

#### CONSTRUCTION

ETP-HYLOC is a hydro-mechanical joint, which consists of a double-walled steel sleeve which encloses a conical moveable piston. Mounting and dismantling is carried out with an external hydraulic pump (supplied separately). In the flange there are three threaded connections ("ON", "P", and "OFF") in the radial direction and the same in the axial. This makes it possible to choose radial or axial connection of the pump hoses, depending on the build-in situation.

Mounting: apply pressure in the "ON" and "P" (not shown) connections. When mounted no hydraulic pressure remains. The small conical angle prevents the piston from releasing.

#### **OPERATION**

When the piston is moved, by the hydraulic pressure from the pump, the double-walled sleeve expands uniformly against shaft and hub to form a rigid joint. When dismantling, the piston is moved in the opposite direction and the joint will loosen. A small amount of oil will be taken via spiral tracks in the piston between the surfaces (pressure applied through the "P" connection), in this way making it easier for the piston to move. Normal working pressure is 1,000 bar. Other pressures can be used - consult with the factory.

Dismantling: apply pressure in the "OFF" and "P" (not shown) connections. ETP-HYLOC returns to its original measurements and the joint is loose.

H = threaded holes for easy handling. Dimensions subject to alterations without notice

#### **Additional Information**

- If your application requires higher torque values, please contact the factory. With modification, we can increase the torque transmission up to two times the catalog values.
- Larges sizes are available upon request, please contact the factory.
- The values published are for hub materials that are made from steel. Please consult the factory if you wish to use other hub material.

#### **Mounting Advice**

- The contact surfaces L and L1 must be completely covered by the shaft and hub.
- Make sure mounting surfaces, shaft, and hub are clean and have good surface finish.
- The oil for the pump should be a transmission oil type 80 W.
- The mounting pressure is normally 1,000 bar. Lower pressures can be used, however, lower pressures will result in lower torque values. Please consult factory for the details.
- Maximum mounting pressure is 1,200 bar.
- Dismantling requires approx. 200 bar higher pressure than for mounting.

- Variable transmittable torque or axial force by changing the mounting pressure.
- Easy mounting/dismantling of large components in tight spaces.
- Quick mounting. Only a grease pump is necessary for mounting.
- Radial and axial connection is possible.
- Fine adjustments of the hub can be made when mounting.
- Good concentricity even after several mountings.

#### DESIGN

ETP-HYDROPRESS is a hydraulic joint which consists of a double-walled steel sleeve. A hydraulic grease pump is required for mounting.

#### **OPERATION**

When the hydraulic pressure from the pump is injected into the ETP-HYDROPRESS the double walled sleeve expands the inner and outer wall of the connection creating a rigid friction joint.

# ETP-KN® Knife Holder

#### **FEATURES**

- Extremely fast mounting/dismantling with only one screw.
- Can be mounted/dismantled 1000's of times.
- Extremely good concentricity, ≤0.006 mm, even after several mountings.
- Radial tightening of the screw saves space along the shaft.
- Accurate positioning, no axial movement when mounting.

#### **DESIGN**

ETP-KN is designed to expand only against the shaft and is used for fastening circular knives for slitting thin steel plates when manufacturing beverage and food cans. ETP-KN is only made to customer's specification. Shaft dimensions 50 – 200 mm.

#### **OPERATION**

When the actuation screw is tightened, the double-walled sleeve expands uniformly against shaft and creates a rigid friction joint. Dismantling is done by loosening the screw which returns the ETP-KN to its original dimensions. It can then easily be dismantled.

# **ETP-UNIGRIP®**

ETP-UNIGRIP is an axial tensioner used, for example, in the clamping of workpieces and tools against a shoulder on the shaft.

ETP-UNIGRIP has two separate hydraulic functions. When tightening the screw (R), ETP-UNIGRIP grips to the shaft. When tightening screw, (A), 3 pistons are pressurized which creates a high axial force (20 kN) against the components which are going to be clamped.

ETP-UNIGRIP is available in a limited range of standard sizes for shafts 35 - 65 mm.

More information can be sent on request. Special versions also with threaded inner diameter can be offered.

For over 70 years, Zero-Max, Inc. has created innovative solutions to servo motion control problems worldwide such as keyless lock bushings, shaft couplings and adjustable speed drives. With strategic distribution points located throughout the world, Zero-Max can deliver your motion control solution. The Zero-Max team of application specialists can engineer a solution to meet your motion control requirements.

The Zero-Max brand is known throughout the world as a mark of quality and performance. It is not uncommon for us to receive a call from a customer who has had one of our products in service for decades.

We enjoy talking to our customers and helping solve difficult applications. With many years of application experience we excel in this area of customer service.

- Experienced practical advice
- Responsive to our customers needs
- Predictable high quality
- Fast delivery
- Integrity
- High value
- ISO 9001:2015 certified

This customized ETP-AXPRESS fastens and centers the decorating cylinder for printing on the outside of beverage cans.

ETP-AXPRESS (a version of ETP-EXPRESS where the pressure setting is done in the axial direction). Decorator for 2 piece beverage cans.

The lever is fastened with ETP-AXPRESS which clamps to the shaft when the screw is tightened.

This lever is used for quick and accurate opening/closing of the blow molder for production of PET bottles.

Some customers tested the ETP solution for a few years, before finally the manufacturer started to use it for new machines.

Complete blow mold unit with several molds/cavities.

ETP-HYCON is a hydromechanical coupling used in the steel/paper or other heavy industries where the requirements are for high performance, compact design, low weight, low inertia, high rigidity and reduced down time for maintenances.

ETP-OCTOPUS is used to lock machine parts that need to be repositioned frequently. Linear repositioning can be done frequently with high precision along the shaft. Actuation is done with an external pressure source.

This ETP-EXPRESS R is made of high grade stainless steel, because it is washed regularly with an aggressive cleaning fluid.

Lever fastened with ETP-EXPRESS to open/close the mold.

# **Transmittable Torque**

The ETP connections are tubular and create a surface pressure on to the shaft and the hub. Through the friction resistance both axial forces and torques can be transmitted. The amount will be determined by the area of the contact length  $(L_s)$ , the surface pressure and the coefficient of friction  $(\mu)$ .

The following formula is valid:  $T = p \cdot \frac{\pi d^2}{2} \cdot L_s \cdot \mu$ 

 $L_s$  = the contact length.

p = surface pressure on the shaft.

Built-in principle of an ETP-connection.

When the loads are in form of alternating or pulsating torque it is recommended to reduce the transmittable torque rating, T. For further information see technical specification sheet for corresponding product.

# **Dimensioning of Hubs and Hollow Shafts**

Because of the even and reasonable surface pressure and the compact built-in dimensions of the ETP connections, a thin material for the hub and shaft can be used. Also aluminium is possible.

For hubs and hollow shafts in steel, the yield point of those materials decides the minimum thickness of the material. For cast iron and aluminium, the module of elasticity is decisive.

The requisite thickness can be selected from the below table or more accurately in the diagram.

NOTE: This information is not valid for ETP-HYLOC or ETP-OCTOPUS.  $\label{eq:continuous} % \begin{subarray}{ll} \end{subarray} % \begin{subarray$ 

ReL = Yield point for the material.

E = Module of elasticity.

 $D_{H}$  = The minimum outer diameter of the hub.

d = The maximum inner diameter of the hollow shaft.

If  $D_H/D < 1.4$  for the hub or if  $d_i/d > 0.6$  for the hollow shaft, contact us for advice.

For all materials there will be an elastic expansion/compression of the hub/hollow shaft.

The expansion/compression will not be uniform of the hub/hollow shaft if the material is unsymmetrical.

For accurate calculation contact us.

#### Recommended Surface Finish, Shaft/Hub

Ra max 3.0 (µm) Ra min 1.0 (µm)

The coefficient of friction depends on a number of factors. The most important are:

#### **SURFACE FINISH**

The surface must not be too smooth. If it is, the influence of impurities can be significant. A good turning operation is often better than grinding.

#### **CLEANLINESS**

It is very important that the surfaces are well cleaned. Grease on the surfaces will drastically reduce the coefficient of friction.

A thin oil will, however, only reduce the coefficient of friction by about 0.03  $\mu.\,$ 

# **Keyways**

If there is a keyway in the shaft or hub, we recommend it to be filled in with, for example, some two component hardening medium (not needed for ETP-MINI). The medium should then be ground to the diameter of the shaft/hub. This prevents deformation and dismantling problems of the double-walled sleeve.

# **Number of Mountings**

One of the qualities with the ETP connections are their ability to be mounted quickly and repeatedly with maintained performance and precision.

There is, however, a limit when the screw/screws will be worn and have to be changed. If the threads are cleaned and regularly lubricated, the guide values in the table can be used.

The values indicate when the screw needs to be changed allowing the ETP connection to last longer.

For the R types it is very important that the screws are well lubricated when tightening, both for proper function and full lifetime capabilities. When used in food processing applications or similar we recommend the lubricant Molykote P-1900. For other applications Molykote G-n plus can be used.

ETP-HYLOC is not recommended for more than 2,000 mountings.

ETP Connection	Number of mountings
ETP-EXPRESS 15-35	2,000
ETP-EXPRESS 38-60	1,000
ETP-EXPRESS 70-100	500
ETP-EXPRESS R 15-35	800
ETP-EXPRESS R 38-60	400
ETP-EXPRESS R 70-80	200
ETP-TECHNO 15-45	5,000
ETP-TECHNO 50-75	3,000
ETP-TECHNO 80-130	500
ETP-POWER 15-30	500
ETP-POWER 32-40	200
ETP-CLASSIC	100
ETP-CLASSIC R	50
ETP-MINI	100
ETP-MINI R	50
ETP-HYLOC	2,000

# **Surface Pressure**

If the surface pressure is too low, a metallic contact between the surfaces will not be created because of oxide layers. If the surface pressure is too high, plastic deformation can occur and the friction will decrease dramatically. The hydraulic ETP principle gives a surface pressure within the right range, which is also even around and along the entire contact area.

The surface pressure from the ETP connections (not ETP-HYLOC) at the recommended tightening torque is approximately 80 N/mm<sup>2</sup>.

# Runout and Balance

The hydraulic ETP principle assures a good runout and balance. All products are balanced by design. For guide values see the table.

To these values the runout/unbalance for shaft and hub in the actual case has to be added in order to get the final value when mounted.

Balancing can be done on request.

ETP-EXPRESS and ETP-TECHNO upon request can be dynamically balanced to G 2.5, at a requested rpm.

Material	ETP-EXPRESS incl. type R and C	ETP-TECHNO	ETP-POWER	ETP-CLASSIC incl. type R	ETP-MINI incl. type R	ETP-HYLOC
Runout (mm)*	≤ 0.02	≤ 0.006	≤ 0.03	0.03 - 0.06	≤ 0.02	≤ 0.02
Unbalance (gmm/kg)	75	50	75	100	100	75**

<sup>\*</sup> Values are also valid after repeated mountings.

<sup>\*\*</sup> For size  $\leq$  100 mm, with radial mounted steel plugs, the unbalance is larger.

# **Temperature**

The pressure medium in hydraulic ETP connections and the double-walled steel sleeve have different volume expansion coefficients. This means that when the temperature rises, the pressure in the connection increases and a higher torque can be transmitted. The opposite is valid at decreasing temperature.

Also the seals built into the connections decides the upper and lower operating temperatures.

The following has to be taken into consideration when the operating temperature differs from the mounting temperature:

- Max. and min. temperature for continuous operation, see table.
   ETP-MINI and ETP-HYLOC can withstand wider upper and lower limits.
- The decrease in torque due to lower operating temperatures, see diagram.
   ETP-MINI and ETP-HYLOC and are not affected.

T = transmittable torque.

TC = transmittable torque at operating temperature.

ETP Connection	Min. Temp. °C	Max. Temp. °C
ETP-EXPRESS incl. type R and C	-30	+85
ETP-TECHNO	-30	+110
ETP-CLASSIC incl. type R	-30	+85
ETP-POWER	0	+70

# Radial Loads and Bending Torque

#### **Examples of Radial Load**

Weight of pulley, sprocket, etc., initial tension from belt, and/or any other radial forces applied to the ETP.

	ETP-EXPRESS incl. type R and C	ETP-TECHNO	ETP-POWER	ETP-CLASSIC incl. type R and C	ETP-MINI incl. type R	ETP-HYLOC
Bending torque as % of transmittable torque, T.	5	10	10	15	30	15

# MEX (55) 53 63 23 31 MTY (81) 83 54 10 18 QRO (442) 1 95 72 60 ventas@industrialmagza.com

# **Torque and Speed**

Due to centrifugal force, the transmittable torque will be reduced with increasing speed (rpm). The diagram gives examples for ETP-TECHNO 50 with a steel hub. A reduced tolerance between the contact surfaces gives a higher surface pressure at the same tightening torque, and thus higher transmittable torque at high speeds. A thicker hub is more effected by the centrifugal force and the torque will reduce faster at increasing speed. The example is not directly applicable for other sizes or types of ETP connections. Contact us for assistance with calculations at high speeds.

## **Axial Force**

If an axial force  $(F_1)$  and a torque  $(T_1)$  are to be transmitted at the same time, the following formula is valid.

$$\left(\frac{F_1}{F_A}\right)^2 + \left(\frac{T_1}{T}\right)^2$$

\( \) 1 this means that the value should be inside the quarter circle in the diagram.

FA and T are the rated values for axial force and torque for the different ETP products.

# **Design Tips**

Most friction joints have limited capacity to transmit radial forces and bending torque. High levels of these loads can affect the function of the ETP connection. The values acc. to the diagram and table based on tests can serve as guide lines. ETP-MINI and ETP-HYLOC can transmit higher radial forces than the other connections.

ETP-TECHNO gives advantages when used to fasten printing cylinders in light materials, for example aluminium. The cylinder can be changed 1,000s of times, using the same ETP-TECHNO, with maintained good concentricity and repeatability. The radial access to the screw facilitates the handling and saves space.
